

Versatile Software for On-Demand Mobility

Follow us on

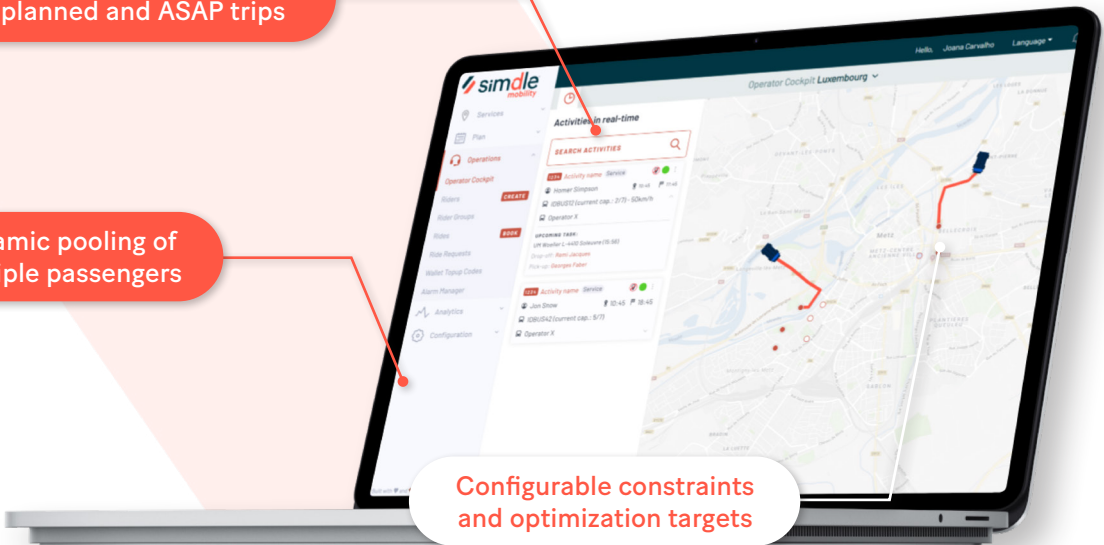

Simdle Optimizer

Achieve unparalleled vehicle productivity with our industry leading real-time routing and optimization algorithm.

Automatic dispatching of pre-planned and ASAP trips

Dynamic pooling of multiple passengers

Configurable constraints and optimization targets

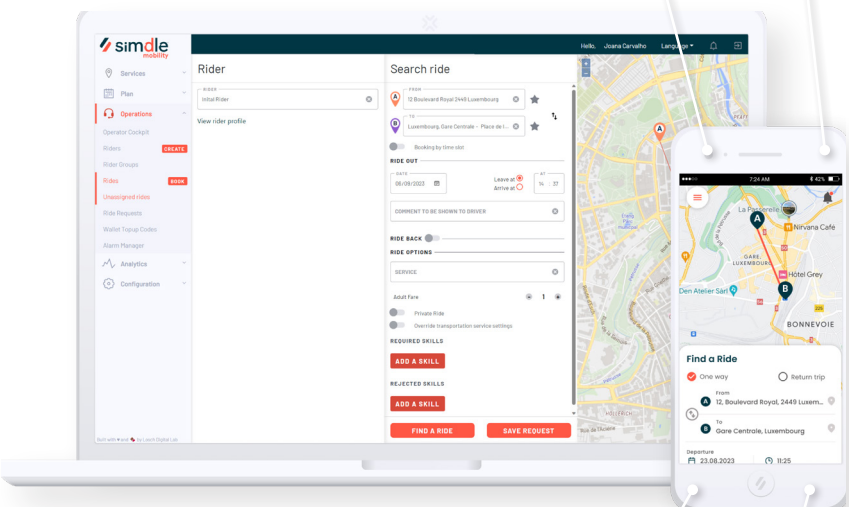

Multiple booking channels

Whether you operate a call center or empower your users with 24/7 booking on the web or through our Rider app, we have the right solution for you.

Web Booking

Push notifications, SMS, e-mail

Real-time vehicle location and ETA

Secure credit-card payments, cash, voucher or quota system

Accessible (WCAG 2.1 compliant)

White Label App

Intermodal MaaS app & Third party integration

Combined public-transport/ on-demand journeys using GTFS or VDV-TRIAS data.

Call Center

Simdle Driver

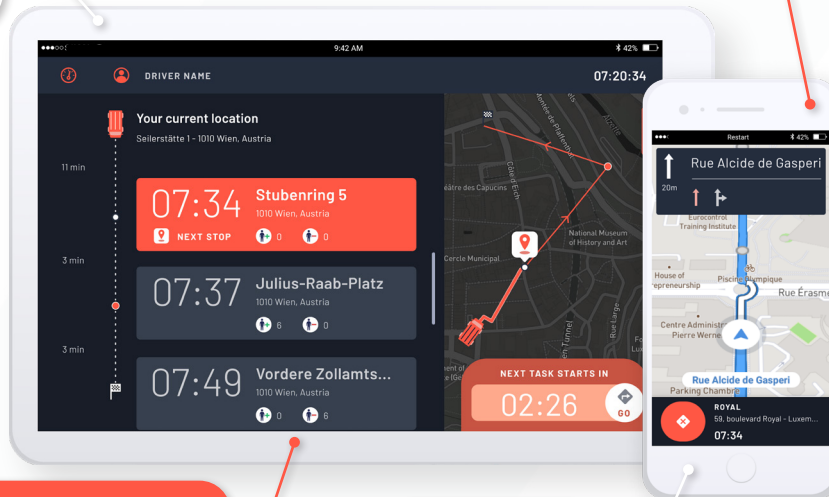

Available for smartphone and tablet

Our native android Driver app automatically connects drivers with their vehicles and tasks.

Automatic alerts and re-routing

In-app turn-by-turn navigation and voice guidance (multilingual voice instructions)

Offline navigation mode

Ticketing

APIs

Integrate Simdle Mobility's solution into your existing IT-environment through our secured REST APIs.

Data and analytics

Get the most out of your data. Instantly.

Access your data for KPIs and invoicing

Reinventing public transport in rural and urban areas

Replace expensive or poorly performing fixed-route bus lines with reliable and cost effective on-demand public transport.

Improve mobility in less densely populated areas or during off-peak hours.

Enhance access to local transport hubs.

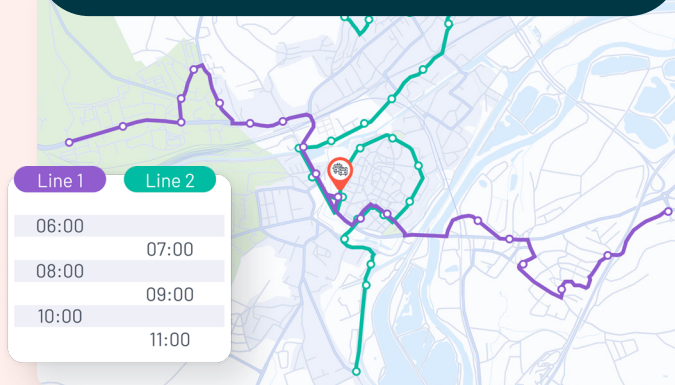

Integrate seamlessly with your MaaS environment.

Replace fixed-route bus lines with on-demand public transport

Increase service area coverage and reduce waiting times significantly, while reusing your bus fleet.

BEFORE : Fixed schedule
low area coverage, long waiting times

- 1 vehicle, 20 passengers / day
- Up to 2h waiting time

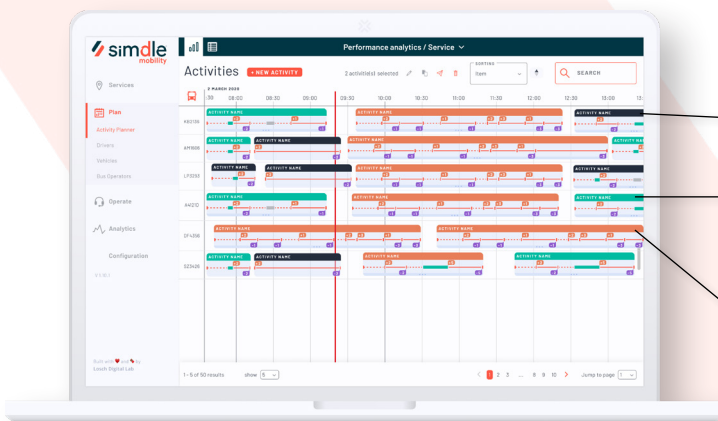

AFTER : On-Demand public transport
high area coverage, reduced waiting times

- 1 vehicle, 90 passengers / day
- 15 min average waiting time

Handle varying demand patterns

Dynamically offer the optimal/best transport mode in response to changing demand patterns.

Peak Hours : Directional demand

Fixed-route service

Corridor service

Directional transportation to train station or business park. Excellent connectivity between bus and train with coordinated schedules

Off-peak hours : Sporadic non-directional demand

Free floating on-demand transportation

Achieve superior vehicle operating productivity

PROBLEM

Most operators struggle to match demand and supply efficiently leading to low productivity.

Supply side

Drivers and Vehicles

CONSTRAINTS

How to match efficiently the Supply side with the Demand side?

CONSTRAINTS

Demand side

Passengers with various needs

SOLUTION

Simple Optimizer engine matches the operator's resources (drivers and vehicles) with different types of demand, taking multiple service and optimisation criteria into account. Each vehicle can now offer multiple services with each service having its own service parameters.

21%

proven productivity increase

Building software with passion

The **automotive industry** is changing tremendously, bringing a lot of new challenges. New mobility concepts, digitalized workflows, modern and mobile platforms: the requirements are versatile. At Losch, we are proactive in tackling digital transformation and we are involved in shaping it ourselves.

Losch Digital Lab was created in 2018 to bring new technological solutions in the field of mobility and to support the Losch Group by digitizing internal processes, but also to provide software solutions to external partners and customers.

With our **talented** and **creative** team, we realize the improvement of existing applications and their transformation into new technologies.

We develop **software solutions**, from software architecture to interface design, testing and deployment, according to the needs of our customers.

Currently, Losch Digital Lab employs more than 40 designers and engineers spread across its two locations in **Kockelscheuer** (Luxembourg) and **Oporto** (Portugal). The management of is in the hands of **Roman Entinger**.

Simdle Mobility is an integral part of Losch Digital Lab's product portfolio. The software solution is designed a **SaaS** (Software-as-a-Service).

**We make sure no vehicle runs
emptier than it should!**
